#### **Outline**

- What is Linux?
- Why use Linux?
- What happens when you log in?
- Shells and environment
- Commands
- Filesystem basics
- Processes
- More about shells

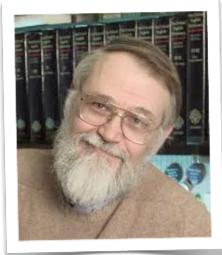

#### What is Linux?

- Part of the Unix family of operating systems.
- Started in early '90s by Linus Torvalds.
- Technically refers only to the kernel; software from the GNU project and elsewhere is layered on top to form a complete OS. Most is open source.
- Several distributions are available from enterprisegrade, like RHEL or SUSE, to more consumer-focused, like Ubuntu.
- Runs on everything from embedded systems to supercomputers.

## Why Use Linux?

- Linux command-line syntax may seem overwhelming to the new user, but:
- It's the default operating system on virtually all HPC systems
- It's extremely flexible
- It tries not to get in your way
- It's fast and powerful
- It was designed by programmers and thus has many potent tools for software development
- You can get started with a few basic commands and build from there

## History of Linux

Brian Kernighan 1970 "space travel" to Unix

Dennis Ritchie 1971

Richard Stallman 1983 Gnu Not Unix

Linus Torvalds 1991 Linux kernel for personal computers

#### users

shell: bash, csh programs commands Linux kernel Computer hardware

## How do you log in?

- To a remote system, use Secure Shell (SSH)
- From Windows GUI app such as PuTTY
- From Linux ssh on the command line
   ssh -X username@login.rc.colorado.edu
- From Mac OS X ssh from the Terminal, or GUI such as Cyberduck or Fugu

## What happens when you log in?

- Login is authenticated (password or key)
- Assigned to a tty
- Shell starts
- Environment is set up
- Prompt

#### What identifies a Linux user?

- Username / UUID
- Group / GID
- Password (or other authentication info)
- GECOS
- Default shell
- Home directory

#### Shells

The shell parses and interprets typed input; passes results to the rest of the OS; returns response as appropriate

- Bourne (sh) early and rudimentary
- Bourne-again (bash) has many user-friendly extensions; default in Linux
- C (csh) has C-like syntax
- T (tcsh) extended version of C
- Korn (ksh) early extension of Bourne; was heavily used for programming
- Z (zsh) includes features of bash and tcsh

#### Shell features

- Tab completion
- History and command-line editing
- Scripting and programming
- Built-in utilities

#### Environment

- Set up using shell and environment variables
  - shell: only effective in the current shell itself
  - environment: carry forward to subsequent commands or shells
- Set default values at login time using .bash\_profile (or .profile). Non-login interactive shells will read .bashrc instead. Use .my.bashrc in RC!
- Initialization scripts should not produce output!
- set var\_name[=value] (shell)
- export VAR\_NAME[=value] (environment)
- env (shows current variables)

#### Useful variables

- PATH: directories to search for commands
- HOME: home directory
- DISPLAY: screen where graphical output will appear
- MANPATH: directories to search for manual pages
- LANG: current language encoding
- PWD: current working directory
- USER: username
- LD\_LIBRARY\_PATH: directories to search for shared objects (dynamically-loaded libs)
- LM\_LICENSE\_FILE: files to search for FlexLM software licenses

## Anatomy of a Linux command

- command [flags] [flag arguments] [target(s)]
- tar —c —f archive.tar mydir
- Flags do not mean the same thing for different commands
- The same command may have different flags in different kinds of Unix (esp. Linux vs BSD)
- Case is important!
- Order of flags may be important

## Most important Linux command

man

man <command>
man -k <keyword>

### File- and directory-related commands

```
pwd – prints full path to current directory
cd – changes directory; can use full or relative path as target
mkdir – creates a subdirectory in the current directory
rmdir – removes an empty directory
rm - removes a file (rm -r removes a directory and all of its
contents)
cp – copies a file
mv – moves (or renames) a file
Is – lists the contents of a directory (1s –1 gives detailed
listing)
chmod/chown – change permissions or ownership
df – displays filesystems and their sizes
du – shows disk usage (du –sk shows size of a directory and
all of its contents in KB)
```

# Process- and program-related commands

ps – lists processes (ps –ef lists all running processes)

top – shows processes currently using the CPU

**kill** – sends a signal to a process (kills process by default). Target is Process-ID; found in 2<sup>nd</sup> column of ps —ef output.

jobs - shows jobs currently in background

**time** – shows how much wall time and CPU time a process has used

nice – changes the priority of a process to get CPU time

## File-viewing commands

less – displays a file one screen at a time

cat – prints entire file to the screen

head – prints the first few lines of a file

tail – prints the last few lines of a file (with –f shows in realtime the end of a file that may be changing)

diff – shows differences between two files

grep – prints lines containing a string or other regular expression

**tee** – prints the output of a command and also copies the output to a file

sort – sorts lines in a file

find – searches for files that meet specified criteria

wc - count words, lines, or characters in a file

## The Linux Filesystem

- System of arranging files on disk
- Consists of directories (folders) that can contain files or other directories
- Levels in full paths separated by forward slashes, e.g. /home/nunez/scripts/analyze\_data.sh
- Case-sensitive; spaces in names discouraged
- are shorthand.

Much more on this in a future session!

## Navigating the filesystem

- Examples:
  - Is
  - mkdir
  - cd
  - rm
- Permissions (modes)

## File editing

- nano simple and intuitive to get started with; not powerful; keyboard driven
- vi/vim universal; keyboard driven; powerful but some learning curve required
- emacs keyboard or GUI versions; helpful extensions for programmers; well-documented
- OpenOffice / LibreOffice for WYSIWYG

http://xkcd.com/378/

#### Processes

- A process is a unique task; it may have threads
- Examples:
  - Foreground vs background (&)
  - jobs command
  - Ctl-C vs Ctl-Z ; bg
  - kill

#### More about shells

- Input and output redirection
  - Send output from a command to a new file with >
  - Append output to an existing file with >>
  - Use a file as input to a command with <</li>
- Pipes: | sends output of one command to another command

```
ps —ef | grep ruprech
```

Quoting – save this for a future session!

## Thank you!

A good introductory online tutorial:
